

SwiftRoute Logistics Dashboard

Project Summary Report

This report presents business insights from logistics data across orders, hubs, drivers, and vehicles. It is written to help management understand performance, identify issues, and make operational decisions.

Project Objective

The project aims to turn logistics data into useful business information. The dashboard supports monitoring of delivery performance, service quality, capacity use, workforce behavior, and fleet health.

Business Problem

The company needs a clearer view of where delays happen, which hubs are overloaded, which drivers are underperforming, and which vehicles create maintenance risk.

Domain Knowledge

The analysis is based on Order Date, Actual Delivery Date, Delay Reason, Driver Name, Hub Name, Hub Capacity, Vehicle Model, Vehicle Status, Customer Satisfaction Score, Delivery Time Hours, and Hub Processing Time Hours.

Dashboard Scope

The report includes four views: Overview, Hubs Overview, Drivers Overview, and Vehicles Overview. Each view supports a different layer of logistics decision-making.

Business Insights

Orders and demand: Total Orders show the load handled in a month, while month-over-month change shows whether the business is growing or slowing down.

Delivery reliability: On-Time Delivery Rate is one of the strongest service indicators because it shows whether customers received orders as promised.

Customer experience: Customer Satisfaction Score connects internal operations with customer perception, so even small delay problems can be seen in this metric.

Delivery speed: Average Delivery Time shows how long the delivery process takes and helps spot slow movement across the network.

Hub efficiency: Orders Processed versus Hub Capacity shows whether a hub is working within limits or handling too much volume.

Hub bottlenecks: Hub Processing Time helps identify where orders are spending too long before dispatch, which can create delay chains.

Driver quality: Experience versus Rating helps show whether skilled drivers are consistently performing well or whether training gaps still exist.

Driver delays: Drivers with the most delays are likely creating avoidable risk and may need coaching, review, or route reallocation.

Fleet risk: Vehicle Age versus Breakdown reveals whether older assets are becoming unreliable and increasing maintenance burden.

Fleet utilization: Orders by Vehicle Model and Vehicle Type show which vehicles are carrying more work and where the fleet may be unbalanced.

Operational Findings

Area	Insight interpretation	Business action
Orders	Demand trends can be tracked monthly.	Plan staffing and capacity for peak months.
Hubs	Some hubs may handle more work than others.	Rebalance workload and review slow hubs.
Drivers	Some drivers may cause more delays than peers.	Coach low performers and review assignment rules.
Vehicles	Older vehicles may break down more often.	Schedule maintenance and replace risky vehicles.

Conclusion

SwiftRoute Logistics Dashboard converts raw logistics data into meaningful business insights. It helps management improve delivery reliability, reduce bottlenecks, strengthen workforce performance, and manage fleet risk more effectively.
